Profile

Design and full-stack engineer who builds products end to end, from interface and animation to APIs, payments and data. Moving into growth: I build the pages, experiments and tools that help products get found and used.

Professional Experience

Fullstack Engineer | Jun 2024 - Present
Freelance, Multiple Clients

- Architected and shipped full-stack marketplace platforms (Next.js, NestJS, Prisma) for multiple clients, including RBAC admin systems, escrow payment flows with idempotent webhook handling, and real-time chat and calls via Socket.io.
- Built True Life Productions' event ticketing platform with SCAPA payment integration and webhook-driven order confirmation, and prevented overselling by consolidating inventory decrements into a single path.
- Built interactive, scroll-driven editorial web experiences with custom animation and a distinct visual identity, taking a creative concept to a fully responsive production site.

Software Developer | May 2025 - Oct 2025
Integrated Software Services Limited

- Solely architected a document intelligence pipeline that parses bank statements into structured exports with automated reconciliation, eliminating about 10 hours of manual processing a week.
- Owned frontend performance end to end, cutting load time by 30% through bundle analysis, lazy loading and a responsive design refactor.

Projects

Scout — Lead Discovery & Growth Audit Tool

- Built a TypeScript and Node.js CLI that pulls 6,300+ YC companies and six public job boards, filters open roles by location, visa and experience, and audits each company's website with 19 checks across search, link previews, AI-agent readiness, content and conversion.
- Generates a responsive HTML report with findings and outreach drafts for each company, caching feeds and respecting robots.txt and each board's terms.

Personal Portfolio — afroBalogun.com

- Built a GSAP-driven portfolio (ScrollTrigger, SplitText, Flip) with an orbital radial navbar and a momentum-drag project scroller, backed by an admin CMS on MongoDB/Mongoose with JWT auth.

Solana Students Africa — Community Website (in progress)

- Building the site in React, Tailwind CSS and GSAP, including a scrapbook-style campus campaign section with horizontal scroll across Nigerian universities.

Research

Agentic Plant Digital Twin — Papers & Hardware Prototype | Oct 2026

- Co-authored two papers on agentic digital twins for smallholder farming, accepted at MIRG-ICAIR 2026 (6th International Conference on Artificial Intelligence Research) and as a poster at the 19th UNILAG Annual Research Conference & Fair.
- Built a ~$40 ESP32-based IoT prototype with a multi-sensor array (temperature/humidity, IR, VOC, CO_2, light, soil moisture) to validate the architecture.

Skills

Languages	TypeScript, JavaScript, HTML/CSS, SQL
Frameworks	React, Next.js, React Native, Tailwind CSS, GSAP, Node.js, NestJS, Express, Spring Boot
Systems	RESTful APIs, webhook-driven architectures, idempotent payment flows, RBAC, real-time (Socket.io), CI/CD
Data	PostgreSQL, MongoDB, Prisma
Frontend & Growth	Responsive design, performance (bundle analysis, lazy loading), technical SEO, link previews, structured data
Hardware & Tools	ESP32, multi-sensor integration, Git, GitHub, Postman

Education

Computer Science | University of Lagos
Emphasis on frontend engineering, web application development, and human-computer interaction. Coursework includes Algorithms and Data Structures, Operating Systems, Computational Methods and Operations Research.
